Prichard Edit ii vol ii p 530

Change of climate "alters the circes under which the foetus is bred" – no other circumstance so important

569 "The slighter differences which mark the species individually, seem to lose themselves in the sameness of form belonging to the genus, and even suggest a suspicion that they all proceeded fr one original The phoenomena of resemblance must have had their sufficient reason as well as those of diversity"

x? He ~~thinks~~ asks is it more probable that "the genus at its first creation was one and uniform, /

x? and afterwards became diversified by the influence of external circumstances"

He thinks however that when "a genus" grew into existence some slight modification in the productive causes stamped it originally with a these specific

x? diversities"

Prichard Ed ii vol ii p 570 (575)

"Varieties branch out fr the common form of a species just as the forms of species deviate from the common type of a genus — * (why should) the one class of phenomena be without of end or utility, a mere effect of contingency or chance, more than the other" x'd

x'd 570 He goes on with examples taken from domestic animals — small mountain cattle &c

571 Variation by law so that structure adapted to circumstances.

505 he infers "that the whole number, in each species respectively, has probably descended fm a single primitive stock": x'd only one family Providence called "into existence" , or race, in each particular kind"

x'd This doesn't look like believe in evoln

Prichard Ed IV vol IV

243 complexion "the development of individ vars is promoted by the influence of particular external agencies, and takes place chiefly in particular climates"
xd

529. "external agencies" cause of Japanese xanthousness

"The Anam & the Thay differ physically.
539 {The difference must be attributed to a long abode in countries of somewhat different climate"
xd
